# Fractional Data for Nonce-Misuse Resistant Mode for Kiasu, Joltik and Deoxys 

Jérémy Jean, Ivica Nikolić, Thomas Peyrin<br>Nanyang Technological University, Singapore. \{JJean, INikolic, Thomas.Peyrin\}@ntu.edu.sg<br>http://www1.spms.ntu.edu.sg/~syllab/CAESAR

April 2, 2014

As mentioned in the original submission documents, KIASU, Joltik and Deoxys support fractional messages, which have not necessarily a length multiple of the block size $n$. As in the COPA [1] article, they make use of two different techniques: first, tag splitting [2] in the case where the size $|M|$ of the message $M$ is strictly smaller than $n$, and second, the XLS technique [3] in the case where $|M|$ is strictly greater than $n$, while not being a multiple of $n$. This was not described in details in the original submission documents and we give in this add-on a full specification of the COPA mode for KIASU, Joltik and Deoxys. We emphasize that empty messages should be treated as partial block, and therefore need $10^{*}$ padding.

Notations. In the sequel, we denote $\lceil X\rceil_{n}$ the value $X$ truncated to its first $n$ bits, and $\lfloor X\rfloor_{n}$ the value $X$ truncated to its last $n$ bits. Moreover, $X \lll a$ will denote the word $X$ rotated by $a$ positions to the left. We recall that $E_{K}(T, M)$ refers to the encryption of message block $M$ using tweak $T$ and key $K$, while $D_{K}(T, M)$ denotes the decryption operation on the same inputs.

Figure 1: Handling the associated data $A$ of length $|A|$. We distinguish two cases, whether $|A|$ is a multiple of the block size $n$ or not.

Figure 2: Handling the message $M$ of length $|M|$. We distinguish three cases depending on the value of $|M|$ in comparison to the block size $n$.
Algorithm 1: The encryption algorithm $\mathcal{E}_{\overline{\bar{K}}}(N, A, M)$. The value $N$ is encoded on $\log _{2}\left(\max _{m}\right)$

```
